Fresh Milk Machine

One of the most innovative features of the Rhea Fresh Milk Machine rhMM2.v+ is the integration of an **efficient cooling system** directly within the refrigerator.

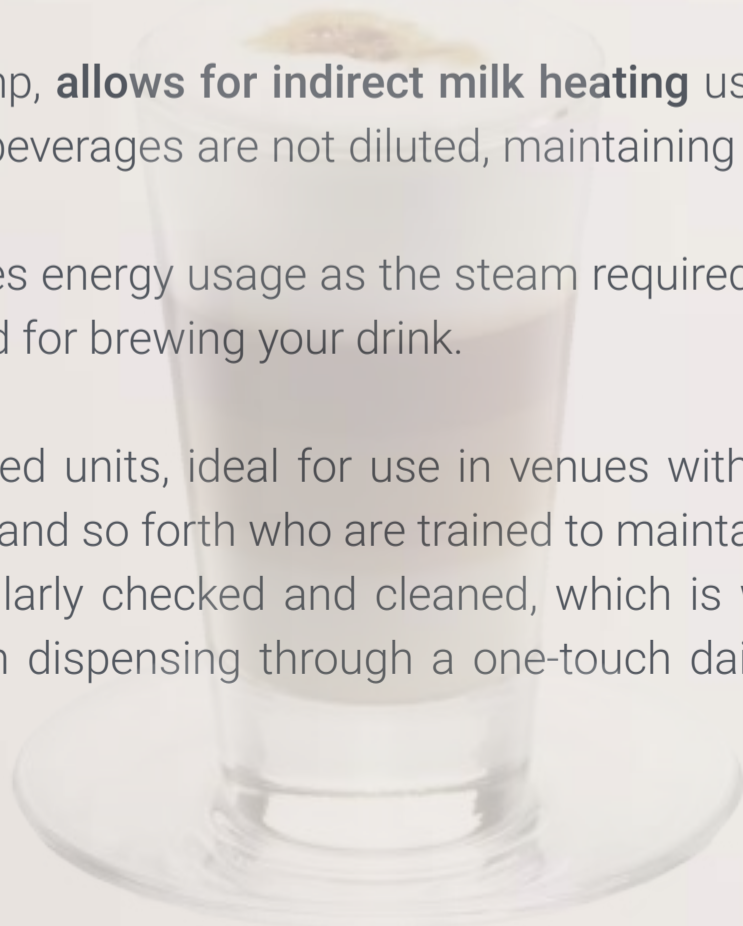

This **integrated refrigeration technology** not only saves space but also enhances the module's overall efficiency.

The cooling unit, equipped with a milk pump, **allows for indirect milk heating** using **Varitherm induction technology**, which ensures that beverages are not diluted, maintaining the **maximum in-cup quality**.

Additionally, this integrated design optimizes energy usage as the steam required for heating is generated using the same heat source used for brewing your drink.

The Rhea Fresh Milk Machines are attended units, ideal for use in venues with service staff, such as **coffee bars, food shops, bakeries** and so forth who are trained to maintain them.

It is essential to ensure the units are regularly checked and cleaned, which is why a rinse is automatically activated at the end of each dispensing through a one-touch daily sanitization program.
